Houston CCS Aliance

October 2023

What is Carbon Capture & Storage?

- Safe, proven technology
- Reduces industrial carbon dioxide (CO₂) and greenhouse gas (GHG) emissions
- Captures CO₂ emissions that would otherwise be released into the atmosphere
- Captured CO₂ is transported to a storage site, then injected into deep underground geological formations for storage

Safe & Proven

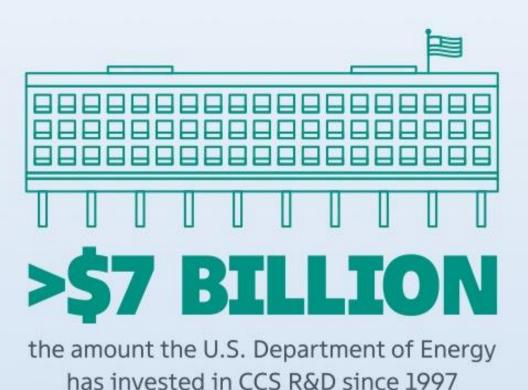

Experts from respected organizations around the world, **including the University of Houston and University of Texas**, conclude:

- Storing CO₂ in geological formations is a safe and viable practice
- CO₂ storage does not pose any major geological threats, including seismic activity

CCS technologies have safely operated for

Air Quality

A first-of-its-kind study by the Great Plains Institute concluded that:

- Installing carbon capture technologies has the potential to improve air quality directly tied to reductions in common emissions like nitrogen oxides, sulfur dioxides and particulate matter, improving health outcomes.
- The Gulf Coast region could see anywhere between \$73 – \$165 million in annual health savings.

GREAT PLAINS

Better Energy. Better World.

Carbon Capture Co-benefits

Carbon Capture's Role in Removing Pollutants and Reducing Health Impacts

August 2023

In addition to significantly reducing CO₂ emissions, deploying CCS technologies will:

Support good-paying jobs associated with existing industries

Continue giving back to the community through volunteering and charitable giving

Stimulate investments in locally-owned businesses

Provide valuable tax revenue that local communities need to fund education, essential public services, and other community initiatives

Studies show that investing in CCS development could create 18,000 jobs annually over a 15-year period, while creating \$60+ billion in private investment across Texas

Making our world more productive

Our Mission

- Help decarbonize the Houston area, • one of the nation's largest concentrated sources of CO₂
- Make Houston the model for an emerging, lower-emission world that supports jobs, economic growth, and prosperity

METRIC TONS PER YEAR BY 2040*

the amount of CO₂ the Houston region could safely capture and store (instead of releasing into the environment), which is approximately the annual emissions of

*according to analysis of data from the U.S. Dept. of Energy (2018) **according to NYC Mayor's Office of Sustainability

TECNOLOGÍA

La captura y almacenamiento de carbono (CAC) es una tecnología segura y probada que reduce las emisiones industriales de dióxido de carbono (CO2) y otros gases de efecto invernadero (GEI). La CAC funciona capturando las emisiones de CO2 que, de otro modo se liberarían a la atmósfera transportándolas a un lugar de almacenamiento, donde se introduce a gran profundidad bajo tierra o baio el lecho marino.

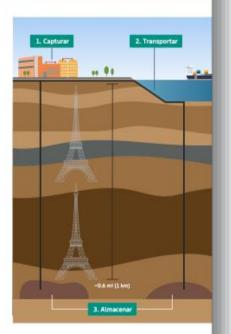

Capturando y almacenando el CO₂ de forma segura, podemos reducir significativamente las emisiones, lo que nos ayudará a situarnos en la senda de un futuro con cero emisiones netas.

BENEFICIOS MEDIOAMBIENTALES

Muchas de las industrias más esenciales del mundo, como la generación de energía, la fabricación pesada o la producción petroquímica, son extremadamente difíciles de descarbonizar. La CAC ofrece la posibilidad de capturar y almacenar de forma segura y permanente el CO₂ y las demás emisiones de gases de efecto invernadero procedentes de procesos industriales cruciales.

La Agencia Internacional de la Energía afirma que, para cumplir

los objetivos climáticos globales, el mundo necesita capturar 28,000 millones de toneladas métricas de CO2 procedentes de este tipo de procesos industriales antes de 2060. El avance de la CAC en Houston puede desempeñar un papel crucial en la reducción de las emisiones de CO2 procedentes de las industrias intensivas en carbono. Colectivamente, los miembros de Houston CCS podrían capturar aproximadamente 50 millones de toneladas métricas de CO2 al año antes de 2030 y 100 millones de toneladas métricas de CO₂ al año antes de 2040.
